**Theorem:** A metric space is compact if and only if it is complete and totally bounded.

**Proof.** Let  $X$  be a metric space with metric  $d$ . If  $X$  is compact, then it is sequentially compact and thus complete. Since  $X$  is compact, the covering of  $X$  by all  $\epsilon$ -balls must have a finite subcover, so that  $X$  is totally bounded.

Now assume that  $X$  is complete and totally bounded. For metric spaces, compact and sequentially compact are equivalent; we prove that  $X$  is sequentially compact. Choose a sequence  $p_n \in X$ ; we will find a Cauchy subsequence (and hence a convergent subsequence, since  $X$  is complete).

Cover  $X$  by finitely many balls of radius 1 (since  $X$  is totally bounded). At least one of those balls must contain an infinite number of the  $p_i$ . Call that ball  $B_1$ , and let  $S_1$  be the set of integers  $i$  for which  $p_i \in B_1$ .

Proceeding inductively, it is clear that we can define, for each positive integer  $k > 1$ , a ball  $B_k$  of radius  $1/k$  containing an infinite number of the  $p_i$  for which  $i \in S_{k-1}$ ; define  $S_k$  to be the set of such  $i$ .

Each of the  $S_k$  is infinite, so we can choose a sequence  $n_k \in S_k$  with  $n_k < n_{k+1}$  for all  $k$ . Since the  $S_k$  are nested, we have that whenever  $i, j \geq k$ , then  $n_i, n_j \in S_k$ . Thus for all  $i, j \geq k$ ,  $p_{n_i}$  and  $p_{n_j}$  are both contained in a ball of radius  $1/k$ . Hence the sequence  $p_{n_k}$  is Cauchy.
